After the Shots...
After the Shots...

What are you doing?

Do you remember when you were a baby?

What is wrong with you?

NO!

I remember very well when I was a baby.

Do you? ...Me too.

What do you remember?
I remember what happened every time I was vaccinated.

I needed extra love and care from my mom because I did not feel very good.

Me too.

Some vaccines can cause discomfort for a while after you have received them.
But my mom and dad always know what to do.

My parents also know everything.

Do they know what to do if you have a fever after the vaccination?

Of course they do!
Mom do you know what to do if I have a fever after the shots?

Of course, I do.

First, I check your temperature to find out if you have a fever.

In order to do this, I use a rectal digital thermometer which is the best choice when you are younger than three years old. The temperature taken this way provides the best reading.

After you were three years old, I checked your temperature by mouth, using an oral digital thermometer.
I know that I should not use a mercury thermometer, because it may break.

There are also tympanic thermometers which measure temperature inside the ear and provide another option for older babies and children.

I prefer when you take my temperature under my arm.

That is an option although it is not as accurate.

What do parents need to do if their children have a fever?
Give your child plenty to drink.

Do not cover or wrap your child tightly, instead clothe your child lightly.

Sponge bathe your child in 1-2 inches of lukewarm water.

I like the medicine you give me.
You can give the child medicine that does not contain aspirin such as ibuprofen or acetaminophen, if necessary.

What if you do all of this and the temperature is still making your child sick?

Then you need to call your clinic or health care provider.
I wonder if my mom knows all of this.

Of course I do and I know more things.

If the child is fussy after the vaccination...

...then, you may want to give your child a medication such as acetaminophen or ibuprofen to reduce pain and fever.
Remember do not give aspirin.

If the child is fussy for more than 24 hours, call your clinic or health care provider.

You know a lot of things!
If the child's leg or arm is swollen, hot or red,...

you need to apply a clean, cool, wet wash cloth over the sore area for comfort.

For pain, you can give a medication such as acetaminophen or ibuprofen. Remember, no aspirin!
If the redness or tenderness increases after 24 hours, then you need to call your clinic or health care provider.

If your child seems really sick,...
...then you need to call your clinic or health care provider if you answer yes to any of the following questions:

Does your child have a temperature above what your health care provider has told you is a concern?

Is your child pale or limp?

Has your child been crying for more than 3 hours and just won't quit?
Does your child have a strange cry that isn’t normal (a high-pitched cry)?

Is your child’s body shaking, twitching, or jerking?

Does your child have marked decrease in activity or decrease in responsiveness?
I like to take a lot of medicine; it is yummy.

No Pepin, medicines are not candies; you need to take only the appropriate doses.

Dad, what are the right doses?

First you need to ask your health care provider or pharmacist which formulation is best for your child.
The dose is based on your child’s weight.

I do not know my weight.

If you do not know the weight give the dose based on your child’s age.

Do not give more medication than recommended. If you are not sure call your clinic or health care provider.
Always use a proper measuring device. For example:

When giving infant drops, use only the dosing device (dropper or syringe) enclosed in the package.

When giving children’s suspension or liquid, use the dosage cup enclosed in the package. If you misplace the dosage cup, consult your health care provider or pharmacist for advice. (Kitchen spoons are not accurate measures.)

Is there anything else, because I am a little bit tired?
If the child is receiving over-the-counter (OTC) medications such as cold preparations, it is important to be aware that these may contain pain or fever reducers such as acetaminophen or ibuprofen.

Be sure to read the medication labels carefully to ensure your child is not receiving more acetaminophen or ibuprofen than recommended.
Let us make a table to understand doses better.

**Acetaminophen dosing information**

Give every 4-6 hours, as needed, no more than 5 times in 24 hours (unless directed to do otherwise by your healthcare provider)

(*) Ask your health care provider
Mom, dad, you are missing something.

We are?

You are forgetting something too.

What are we missing?

A lot of hugs for the child after the vaccination.
