## <u>Is the vaccine safe</u> for me and my baby? What has changed over time?

- Early in the pandemic, we didn't know the effects of the vaccine on pregnant and breastfeeding women and their babies.
- Now, we have lots of data, and we can confidently say: the COVID-19 vaccines are very safe for you and your baby, before, during, and after your pregnancy!
- As of February 2022, more than **200,000** pregnant women have been vaccinated against COVID-19.
- There have been **no** reports of any increased risk of pregnancy loss, growth problems, or birth defects.
- COVID-19 vaccines are not live vaccines, and pregnant and breastfeeding women and their babies cannot get COVID-19 from the vaccine.
- There is **no need to 'pump and dump'** when getting a vaccine while breastfeeding.

# In fact, the real risk is when a pregnant woman chooses NOT to get vaccinated.

Women who become ill with COVID-19 and have symptoms during pregnancy:

- Are more likely to get very sick from COVID-19 compared to those who are not pregnant.
- Are more likely to need ICU care.
- Are more likely to need a breathing tube.
- Are at an increased risk of dying.
- Are at an increased risk of having a stillbirth or preterm birth.
- Are at an increased risk of having a baby infected with COVID-19.

# HOW DO I GET A COVID-19 VACCINE?

- Contact your local health department to make an appointment or ask them where mobile vaccine clinics are located.
- ✓ Talk to your OB/GYN.
- Check with your local pharmacy. They will likely offer vaccines.
- Contact your local community health center to make an appointment.
- **Speak with your employer** about getting a COVID-19 vaccine. They may be helpful in making arrangements to get a vaccine.
- Check to see whether vaccines are offered for free at your state or local health department or local pharmacy. Check to see if fees can be waived.

## COVID-19 VACCINES ARE SAFE AND EFFECTIVE

#### Types of vaccines available in the US:

- Pfizer
- Moderna
- Johnson & Johnson (J&J)
- Novavax

Get your primary series doses. 2 months later, get one bivalent booster.

### RECOMMENDATIONS

- + Get vaccinated. Get Boosted.
- + Get your family vaccinated and boosted.
- + Wear a mask when indoors even when you are up to date on your vaccines. Wear a mask in crowded outdoor settings.
- If you are up to date on your vaccines and are exposed to COVID-19:
  - If you have symptoms: Test immediately. If you have a negative test, test again in 48 hours.
  - If you do not have symptoms: Test at least 5 days after exposure. If you have a negative test, test again after 48 hours, and then again after another 48 hours if your second results are negative. Get medical advice if you think you are ill.
- For women who are pregnant, breastfeeding, or trying to get pregnant, vaccines are critical for keeping moms and their babies healthy.

 For women between 18-60 years old, we recommend getting Pfizer or Moderna.

## WHAT TO KNOW WHEN GETTING THE COVID VACCINE

It is important to get vaccinated, even if you have had COVID-19.

There are various types of vaccines. All vaccines against COVID-19 are safe and effective.

You will feel better a few days after your injection.

Continue to wear a mask in crowded spaces and wash your hands.

It does NOT require any form of identification.

After vaccination you may experience: arm pain, headache, fever, or chills.

You are considered fully vaccinated two weeks after your final dose.

You did your part to protect yourself and others from COVID-19!

### **BENEFITS OF VACCINATION**

- Vaccination protects you, your family, your children, and your co-workers from becoming seriously ill and being hospitalized.
- Vaccination decreases risks for moms and their babies.
- Vaccination decreases the number of new, severe and deadly COVID-19 cases in your community.
- Vaccination protects hospitals and healthcare providers from being overwhelmed with patients severely ill with COVID-19.
- The more people vaccinated in our community, the less we need to worry about new variants.
- Reduces the risk of stillbirth by 15%
- Antibodies from vaccinated women can pass to their babies and possibly protect babies from COVID-19.

## **RISKS FOR UNVACCINATED**

- X Higher risk of COVID-19 infection.
- X Higher risk of serious infection, hospitalization, and death.
- X Higher risk of being exposed to new mutations that are more contagious and dangerous.
